

1. Objective

The purpose of this lab is to become familiar with the analytics tools used to measure online performance, which is a core part of search engine optimization and digital marketing. The lab has three tasks:

- **Google Analytics:** analyze the users, sessions, and traffic sources of the website mandipstha.com.np.
- **Facebook (Meta) Insights:** identify the reach and engagement of the Facebook Page "Dil Maina Pharmacy" (ID: 100063452176369).
- **X (Twitter) Analytics:** analyze the impressions and engagement rate of recent posts by the account "Kevin De Bruyne".

2. Tools and Methodology

Platform	Tool	Subject
Website	Google Analytics 4 (GA4)	mandipstha.com.np
Facebook	Meta Business Suite, Insights	Dil Maina Pharmacy (Page)
X (Twitter)	X Analytics	Kevin De Bruyne (account)

The reporting period is 28 days (2 to 29 September 2026). Because real account data is private, sample data was used. The steps followed on each platform and the metrics recorded are described below with the results.

Key formulas used:

- **Facebook engagement rate** = $(\text{total interactions} \div \text{reach}) \times 100$
- **X engagement rate** = $(\text{total engagements} \div \text{impressions}) \times 100$
- **Channel share** = $(\text{channel sessions} \div \text{total sessions}) \times 100$

3. Task 1: Google Analytics (mandipstha.com.np)

3.1 Procedure

In GA4, the property was selected and the date range set to the last 28 days. Users and engagement were read from Reports > Engagement > Overview. Sessions and traffic sources were read from Reports > Acquisition > Traffic acquisition, using the "Session default channel group" dimension.

3.2 Overview metrics

Metric	Value
Total users	640
New users	505
Sessions	920
Engagement rate	61.4%
Average engagement time	1 min 48 s

3.3 Traffic sources

Channel	Sessions	Share	Engagement Rate
Organic Search	368	40.0%	68.2%
Direct	230	25.0%	55.1%
Referral	115	12.5%	63.0%
Organic Social	106	11.5%	42.3%
Email	64	7.0%	72.5%
Paid Search	37	4.0%	47.8%

3.4 Analysis

- **Organic Search leads:** it brings 40% of all sessions with a strong 68.2% engagement rate. This means people searching on Google and other search engines are finding the website, which shows that SEO is working.
- **Email is the most engaged channel** (72.5%), although it is only 7% of sessions, so email campaigns and newsletters deserve more investment.
- **Organic Social has the lowest engagement** (42.3%), suggesting visitors from social posts leave quickly. Posts should link to specific pages rather than the homepage.
- **Returning visitors:** New users are about 79% of total users (505 of 640), so the site attracts many first-time visitors but should work on bringing them back.

4. Task 2: Facebook Insights (Dil Maina Pharmacy)

4.1 Procedure

Insights are found in Meta Business Suite > Insights > Overview. The Page (ID: 100063452176369) was selected, the 28-day date range was set, and reach, views, interactions, and content performance were recorded. The engagement rate was then calculated with the formula above.

4.2 Overview metrics

Metric	Value
Reach (unique people)	4,200
Views (impressions)	9,800
Interactions	358
Engagement rate	8.5%
Views per person reached	2.3

4.3 Performance by content type

Content Type	Posts	Reach	Interactions	Eng. Rate
Video	12	1,900	190	10.0%
Photos	15	1,300	104	8.0%
Text statements	10	700	49	7.0%
Links	5	300	15	5.0%

4.4 Analysis

- **Video is the strongest format:** about 45% of total reach and the highest engagement rate (10.0%).
- **Link posts perform worst** (5.0%) because Facebook tends to limit the distribution of posts that send users off the platform.
- **Repeat exposure:** views are 2.3 times reach, so the average person saw the content more than twice, which reflects a highly active audience.

5. Task 3: X Analytics (Kevin De Bruyne)

5.1 Procedure

In X Analytics, the last 28 days were selected. Impressions, engagements, and engagement rate were recorded for recent posts, which were then grouped by post type and compared.

5.2 Overview metrics

Metric	Value
Posts published	40
Total impressions	82,000,000
Total engagements	2,900,000
Overall engagement rate	3.5%

5.3 Performance by post type

Post Type	Impressions	Engagements	Eng. Rate
Match highlight with video	14,500,000	812,000	5.6%
Match-day text update	11,200,000	448,000	4.0%
Image graphic	9,800,000	313,600	3.2%
Link to interview/article	2,000,000	40,000	2.0%

5.4 Analysis

- **Video highlight posts** achieve both the highest impressions (14.5M) and the highest engagement rate (5.6%).
- **Reach and engagement rate are different measures:** image graphics earned 9.8M impressions but a lower engagement rate (3.2%) than text updates (4.0%), so both must be read together.
- **Link posts perform worst** (2.0%), as users tend to stay on the timeline rather than click out.

6. Cross-Platform Comparison

Platform	Best Performer	Weakest	Key Metric
mandipstha.com. np	Organic Search, Email	Organic Social	920 sessions; 61.4% engagement
Facebook	Video	Links	4,200 reach; 8.5% engagement
X	Video highlights	Link posts	82M impressions; 3.5% engagement

A common pattern appears across all three platforms: native and visual content (video) outperforms content that sends users elsewhere (links). On the website, search and email bring the highest quality traffic, while social traffic is high in volume but low in engagement.

7. Recommendations

- **Website:** optimize key pages for search keywords, grow the email list, and point social posts to specific landing pages.
- **Facebook:** prioritize short videos and photos, and limit link-only posts.
- **X:** lead with native video and image posts; keep link posts to a minimum.
- **General:** review analytics monthly, compare against the previous period, and repeat the formats that perform best.

8. Conclusion

This lab demonstrated how Google Analytics, Meta Insights, and X Analytics measure users, reach, impressions, and engagement. Using sample data, it showed that the volume metrics (users, reach, impressions) and the quality metrics (engagement rate) tell different stories and must be read together. Data-driven decisions, such as favoring video content and strengthening organic search, are the practical outcome of analytics in SEO and digital marketing.

9. Limitations

All numbers are illustrative sample data and do not represent the actual performance of mandipstha.com.np, the Dil Maina Pharmacy Facebook Page, or the Kevin De Bruyne X account. In a real lab, values would be taken directly from each platform's dashboard and supported with screenshots.
